Outline

Overview:
components &
guidelines

Arguments :
matching &
evaluation

Functions as objects:
benefits & usage

Function

Function

- Why do we need functions ?

```
student.physics.quiz.marks <- c( 70L , 75L , 80L, 85L)
```

```
student.physics.viva.marks <- c( 7L , 5L , 8L, 6L)
```

```
student.physics.total.marks <- student.physics.quiz.marks +  
student.physics.viva.marks
```

```
student.physics.total.marks
```

Function

- Why do we need functions ?

```
student.chemistry.quiz.marks <- c( 70L , 75L , 80L, 85L)
```

```
student.chemistry.viva.marks <- c( 7L , 5L , 8L, 6L)
```

```
student.chemistry.total.marks <- student.chemistry.quiz.marks  
+ student.chemistry.viva.marks
```

```
student.chemistry.total.marks
```

Function

- Demo

Function Components

Function name	Keyword	Arguments	
<u>GetTotalMarks</u>	<-	<u>function(quiz.marks, viva.marks)</u>	{
			total.marks <- quiz.marks + viva.marks
			total.marks
			}

Body

Return value

Function Naming Guidelines

- Google R style guide
 - Initial capital letters
 - With no dots, underscore etc.

AddExtraMarks	✓
addExtraMarks	✗
Add.Extra.Marks	✗
Add_Extra_Marks	✗

Argument Matching

```
MyFunction(v1, v2)
```

The diagram illustrates argument matching in R. It shows a function call `MyFunction(v1, v2)` at the top and a function definition `MyFunction <- function(x, y) { #body }` at the bottom. An orange double-headed arrow connects the arguments `v1` and `v2` in the call to the parameters `x` and `y` in the definition. Each parameter/argument pair is enclosed in an orange box.

```
MyFunction <- function(x, y) {  
  #body  
}
```

Argument Matching

- Match by position

```
GetTotalMarks <- function(quiz.marks, viva.marks) {  
  total.marks <- quiz.marks + viva.marks  
  total.marks  
}  
  
GetTotalMarks(c(70L, 75L, 80L, 85L), c(7L, 5L, 8L, 6L))
```

Argument Matching

- Match by name

```
GetTotalMarks <- function(quiz.marks, viva.marks) {  
  total.marks <- quiz.marks + viva.marks  
  total.marks  
}
```

```
GetTotalMarks(quiz.marks = c(70L, 75L, 80L, 85L), viva.marks = c(7L, 5L, 8L, 6L))
```

```
GetTotalMarks(viva.marks = c(7L, 5L, 8L, 6L), quiz.marks = c(70L, 75L, 80L, 85L)) # reorder arguments
```

Arguments With Default Values

- Also known as default argument
- An argument which is not required to specify

Assignment marks	5	5	5	5
	2	1	3	4

Arguments With Default Values

- Demo

Additional Arguments Using Ellipsis

- Represented by three dots (...)
- A special argument
- Means “anything else”

Additional Arguments Using Ellipsis

- Demo

Lazy Evaluation

- Evaluation of an expression is deferred until it is first used
- Common in functional programming languages

Lazy Evaluation

- Demo

Multiple Return Values

- Use **list** with a **return** statement

Multiple Return Values

- Demo

Functions as Objects

- **Functions as first class objects**
 - Look into them
 - Assign them
 - Pass them as arguments to other functions

Functions as Objects

- Demo

Anonymous Function

- **Function without any name**
- **Use it if you have to create small functions**

Anonymous Function

- Demo
